(54) Title: **INK JET EJECTOR**

(57) Abstract: A paddle (5) for a liquid ejection device (1) is located in a chamber (2) and is moveable in a forward direction between a rest state and an ejection state, for ejecting fluid from the chamber through an outlet port (11) as it moves from the rest state to the ejection state. The paddle (5) is positioned to substantially close an inlet port (3) when in the rest state and the paddle (5) and the inlet port (3) define an aperture (16) between themselves. The paddles (5) includes means (12) to reduce fluid flow through the aperture (16) toward the inlet port (3) as the paddle (5) moves from the rest state to the ejection state.

## **“INK JET EJECTOR”**

### **FIELD OF THE INVENTION**

The present invention relates to the field of Micro Electro Mechanical Systems (MEMS), and specifically inkjet printheads formed using MEMS  
5 technology.

### **BACKGROUND OF THE INVENTION**

MEMS devices are becoming increasingly popular and normally involve the creation of devices on the micron scale utilising semiconductor fabrication techniques. For a recent review on MEMS devices, reference is made to the  
10 article “The Broad Sweep of Integrated Micro Systems” by S. Tom Picraux and Paul J. McWhorter published December 1998 in IEEE Spectrum at pages 24 to 33.

MEMS manufacturing techniques are suitable for a wide range of devices, one class of which is inkjet printheads. One form of MEMS devices in popular  
15 use are inkjet printing devices in which ink is ejected from an ink ejection nozzle chamber. Many forms of inkjet devices are known.

Many different techniques on inkjet printing and associated devices have been invented. For a survey of the field, reference is made to an article by J Moore, “Non-Impact Printing: Introduction and Historical Perspective”, Output  
20 Hard Copy Devices, Editors R Dubeck and S Sherr, pages 207 to 220 (1988).

Recently, a new form of inkjet printing has been developed by the present applicant, which is referred to as Micro Electro Mechanical Inkjet (MEMJET) technology. In one form of the MEMJET technology, ink is ejected from an ink ejection nozzle chamber utilizing an electro mechanical actuator connected to a  
25 paddle or plunger which moves towards the ejection nozzle of the chamber for ejection of drops of ink from the ejection nozzle chamber.

The present invention concerns modifications to the structure of the paddle and/or the walls of the chamber to improve the efficiency of ejection of fluid from the chamber and subsequent refill.

## SUMMARY OF THE INVENTION

In accordance with a first aspect of the invention there is provided a liquid ejection device including:

a fluid chamber having:

- 5 a fluid outlet port in a wall of the chamber;
- a fluid inlet port in a wall of the chamber;
- a paddle located in the chamber and moveable in a forward direction between a rest state and an ejection state, for ejecting fluid from the chamber through the outlet port as it moves from the rest state to the ejection state;
- 10 the paddle positioned to substantially close the inlet port when in the rest state, the paddle and the inlet port defining an aperture there between; and, the paddle including first means to reduce fluid flow chamber through the aperture toward the inlet port as the paddle moves from the rest state to the ejection state.

- 15 The first means to reduce fluid flow may include one or more baffles on a forward surface of the paddle to inhibit or deflect fluid flow.

The first means to reduce fluid flow may include an upturned portion of the peripheral region of the forward surface.

- 20 The first means to reduce fluid flow may include at least one depression, groove projection, ridge or the like on the forward surface of the paddle.

The projection or depression may comprise a truncated pyramid.

The ridge or groove may be linear, elliptical, circular, arcuate or any appropriate shape.

- 25 Where multiple ridges or grooves are provided they may be parallel, concentric or intersecting.

The forward surface of the wall of the chamber adjacent the fluid inlet port may also be provided with second means to reduce fluid flow through the aperture toward the inlet port as the paddle moves from the rest state to the ejection state.

The second means may be an angling into the chamber of the forward surface of the wall of the chamber around the fluid inlet port.

The rear surface of the paddle may include third means to encourage fluid flow into the chamber as the paddle moves from the ejection state to the rest state.

The third means may be an angling into the chamber of the rear surface of the paddle.

The angling of the rear surface may be limited to the peripheral region of the rear surface.

The port may be configured to encourage fluid flow into the chamber as the paddle moves from the ejection state to the rest state.

The surface of the wall of the inlet port adjacent to paddle may be angled into the chamber such that the aperture decreases in area toward the chamber.

The paddle may be a constant thickness.

In another aspect the invention provides a liquid ejection device including:

a fluid chamber having:

a fluid outlet port in a wall of the chamber;

a fluid inlet port in a wall of the chamber;

a paddle located in the chamber and moveable in a forward direction between a rest state and an ejection state, for ejecting fluid from the chamber through the outlet port as it moves from the rest state to the ejection state; wherein the paddle is positioned to substantially close the inlet port when in the rest state, the paddle and the port defining an aperture there between; and,

wherein the paddle has a forward surface, the forward surface having a central portion and a peripheral portion, at least part of the peripheral portion extending outwardly from the central portion in the first direction.

All of the peripheral portion may extend at a constant angle to the forward direction or it may be curved.

The central portion may extend generally perpendicular to the first direction. The paddle may be of a constant thickness.

The forward surface of the wall of the chamber defining the inlet port may be planar but is preferably angled upward into the chamber.

5 The inlet port is preferably defined by the wall of the chamber extending over the end of a fluid passage way. At least part of the walls of the chamber are preferably angled toward the chamber to form a convergent inlet in the downstream direction.

10 In another aspect of the invention also provides a method of manufacturing a micro mechanical device which includes a movable paddle, the method utilising semi conductor fabrication techniques and including the steps of:

- a) depositing a first layer of sacrificial material;
- b) depositing at least a second layer of sacrificial material on a selected  
15 part or parts of the first layer; and
- c) depositing a paddle forming layer of material over the first and second layers of sacrificial material to form a non-planar paddle.

The step b) may include depositing a one or more additional layers of sacrificial material on selected parts of the second layer.

20 The additional layer or layers may be deposited on all of the second layer or only on part of the second layer. The paddle so formed may thus be multi-levelled.

Preferably the sacrificial material is a polyimide.

25 Preferably the second layer is deposited to lie under the peripheral region of the as yet unformed paddle.

## **BRIEF DESCRIPTION OF THE DRAWINGS**

Notwithstanding any other forms which may fall within the scope of the present invention, preferred forms of the invention will now be described, by way of example only, with reference to the accompanying drawings, in which:

Fig. 1 illustrates schematically a sectional view of a thermal bend actuator type ink injection device;

Fig. 2 illustrates a sectional view through a nozzle chamber of a first embodiment with the paddle in a quiescent state;

5 Fig. 3 illustrates the fluid flow in the nozzle chamber of the first embodiment during a forward stroke;

Fig. 4 illustrates the fluid flow in the nozzle chamber of the first embodiment during mid-term stroke;

10 Fig. 5 illustrates the manufacturing process in the construction of a first embodiment of the invention;

Fig. 6 is a sectional view through a second embodiment of the invention;

Fig. 7 is a sectional plan view of the embodiment of Fig. 6; and

Fig. 8 illustrates the manufacturing process in construction of the second embodiment of the invention.

## 15 DESCRIPTION OF PREFERRED AND OTHER EMBODIMENTS

In the preferred embodiment, a compact form of liquid ejection device is provided which utilises a thermal bend actuator to eject ink from a nozzle chamber.

20 As shown in Fig. 1, there is provided an ink ejection arrangement 1 which comprises a nozzle chamber 2 which is normally filled with ink so as to form a meniscus 10 around an ink ejection nozzle 11 having a raised rim. The ink within the nozzle chamber 2 is resupplied by means of ink supply channel 3.

The ink is ejected from a nozzle chamber 2 by means of a thermal actuator 7 which is rigidly interconnected to a nozzle paddle 5. The thermal  
25 actuator 7 comprises two arms 8, 9 with the bottom arm 9 being interconnected to an electrical current source so as to provide conductive heating of the bottom arm 9. When it is desired to eject a drop from the nozzle chamber 2, the bottom arm 9 is heated so as to cause rapid expansion of this arm 9 relative to the top arm 8. The rapid expansion in turn causes a rapid upward movement of the

paddle 5 within the nozzle chamber 2. This initial movement causes a substantial increase in pressure within the nozzle chamber 2 which in turn causes ink to flow out of the nozzle 11 causing the meniscus 10 to bulge.

Subsequently, the current to the heater 9 is turned off so as to cause the paddle 5  
5 to begin to return to its original position. This results in a substantial decrease in the pressure within the nozzle chamber 2. The forward momentum of the ink outside the nozzle rim 11 results in a necking and breaking of the meniscus so as to form a meniscus and a droplet of ink 18 (see Fig. 4). The droplet 18 continues forward onto the ink print medium as the paddle returns toward its rest  
10 state. The meniscus then returns to the position shown in Fig. 1, drawing ink past the paddle 5 in to the chamber 2. The wall of the chamber 2 forms an aperture in which the paddle 5 sits with a small gap there between.

Fig. 2 illustrates a sectional view through the nozzle chamber 2 of a first embodiment of the invention when in an idle state. The nozzle chamber paddle  
15 5 includes an upturned edge surface 12 which cooperates with the nozzle paddle rim edge 13. There is an aperture 16 between the paddle 5 and the rim 13. Initially, when it is desired to eject a drop of ink, the actuator (not shown) is activated so as to cause the paddle 5 to move rapidly in an upward (or forward) direction, indicated by arrow A in Fig. 3. As a result, the pressure within the  
20 nozzle chamber 2 substantially increases and ink begins to flow out of the nozzle chamber, as illustrated in Fig. 3, with the meniscus 10 rapid bulging. The movement of the paddle 5 and increased pressure also cause fluid to flow from the centre of the paddle 5 outwards toward the paddle's peripheral edge as indicated by arrows 15. The fluid flow across the paddle is diverted by the  
25 upturned edge portion 12 so as to tend to flow over the aperture 16 between the paddle 5 and the wall 13 rather than through the aperture. There is still a leakage flow through the aperture 16, but this is reduced compared to devices in which one or both of the paddle 5 and wall 13 are planar. The profiling of the edges 12 and 13 thus results in a substantial reduction in the amount of fluid  
30 flowing around the surface of the paddle upon upward movement. Higher

pressure is achieved in the nozzle chamber 2 for a given paddle deflection, resulting in greater efficiency of the nozzle. A greater volume of ink may be ejected for the same paddle stroke or a reduced paddle stroke (and actuator power consumption) may be used to eject the same volume of ink, compared to a planar paddle device.

Whilst the peripheral portion 13 of the chamber wall defining the inlet port is also angled upwards, it will be appreciated that this is not essential.

Subsequently, the thermal actuator is deactivated and the nozzle paddle rapidly starts returning to its rest position as illustrated in Fig. 4. This results in a general reduction in the pressure within the nozzle chamber 2 which in turn results in a general necking and breaking of a drop 18. The meniscus 10 is drawn into the chamber 2 and the returns to the position shown in Fig. 2, resulting in ink being drawn into the chamber, as indicated by arrows 19 in Fig. 4.

The profiling of the lower surfaces of the edge regions 12, 13 also assists in channelling fluid flow into the top portion of the nozzle chamber compared to simple planar surfaces.

The rapid refill of the nozzle chamber in turn allows for higher speed operation.

#### Process of Manufacture

The arrangement in Fig. 5 illustrates one-half of a nozzle chamber, which is symmetrical around axis 22. The manufacturing process can proceed as follows:

1. The starting substrate is a CMOS wafer 20 which includes CMOS circuitry 21 formed thereon in accordance with the required electrical drive and data storage requirements for driving a thermal bend actuator 5.
2. The next step is to deposit a 2 micron layer of photoimageable polyimide 24. The layer 24 forms a first sacrificial layer which is deposited by means of spinning on a polyimide layer; soft-baking the layer, and

exposing and developing the layer through a suitable mask. A subsequent hard-bake of the layer 24 shrinks it to 1 micron in height.

3. A second polyimide sacrificial layer is photoimaged utilizing the method of step 2 so as to provide for a second sacrificial layer 26. The shrinkage of the layer 26 causes its edges to be angled inwards.

4. Subsequently, a third sacrificial layer 27 is deposited and imaged again in accordance with the process previously outlined in respect of step 2. This layer forms a third sacrificial layer 27. Again the edges of layer 27 are angled inwards. It will be appreciated that the single layer 26 may be sufficient by itself and that layer 27 need not be deposited.

5. The paddle 28 and bicuspid edges, e.g. 29, 30 are then formed, preferably from titanium nitride, through the deposit of a 0.25 micron TiN layer. This TiN layer is deposited and etched through an appropriate mask.

6. Subsequently, a fourth sacrificial layer 32 is formed, which can comprise 6 microns of resist, the resist being suitably patterned.

7. A 1 micron layer of dielectric material 33 is then deposited at a temperature less than the decomposition temperature of resist layer 32.

8. Subsequently, a fifth resist layer 34 is also formed and patterned.

9. A 0.1 micron layer of dielectric material, not shown, is then deposited.

10. The dielectric material is then etched anisotropically to a depth of 0.2 microns.

11. A nozzle guard, not shown, if required, is then attached to the wafer structure.

12. Subsequently the wafer is prepared for dicing and packaging by mounting the wafer on an UV tape.

13. The wafer is then back etched from the back surface of the wafer utilizing a deep silicon etching process so as to provide for the ink channel supply while simultaneously separating the printhead wafer into individual printhead segments.

Referring to Figs. 6 and 7 there is shown a second embodiment having similar components to those of the first embodiment, and so the same numbers are used as for the first embodiment.

In the Figs. 6 and 7 embodiment the paddle is formed with a series of truncated pyramidal protrusions in the central portion of the paddle. These protrusions aid in reducing fluid flow outward from the centre of the paddle 5 as the paddle moves upward. Whilst the Figs. 6 and 7 embodiment is provided with a series of discrete truncated pyramidal protrusions, a series of ridges may be provided instead. Such ridges may be paralleling, concentric or intersecting. 10 The ridges may be elliptical, circular, arcuate or any other shape.

Fig. 8 illustrates the manufacturing process of the embodiment of Figs. 6 and 7. The process is the same as that described with reference to Fig. 5 except that at steps 3 and 4, the sacrificial layers 26 and 27 are also deposited to be underneath the as yet unformed central portion of the paddle layer 28, as 15 indicated by the numerals 26B and 27A.

It would be appreciated by a person skilled in the art that numerous variations and/or modifications may be made to the present invention as shown in the specific embodiment without departing from the spirit or scope of the invention as broadly described. The present embodiments are, therefore, to be 20 considered in all respects to be illustrative and not restrictive.

**I claim:**

## 1. A liquid ejection device including:

a fluid chamber having:

5 a fluid outlet port in a wall of the chamber;

a fluid inlet port in a wall of the chamber;

a paddle located in the chamber and moveable in a forward  
direction between a rest state and an ejection state, for ejecting  
fluid from the chamber through the outlet port as it moves from the  
rest state to the ejection state;

10 the paddle positioned to substantially close the inlet port when in  
the rest state, the paddle and the inlet port defining an aperture  
there between; and,

15 the paddle including first means to reduce fluid flow chamber  
through the aperture toward the inlet port as the paddle moves  
from the rest state to the ejection state.

2. The liquid ejection device of claim 1 wherein the first means to reduce  
fluid flow includes one or more baffles on a forward surface of the paddle  
20 to inhibit or deflect fluid flow.

3. The liquid ejection device of claim 1 wherein the first means to reduce  
fluid flow includes an upturned portion of the peripheral region of the  
forward surface.

25 4. The liquid ejection device of claim 1 wherein the first means to reduce  
fluid flow includes at least one depression, groove projection, ridge or the  
like on the forward surface of the paddle.

5. The liquid ejection device of claim 4 wherein the at least one projection or depression includes a truncated pyramid.
6. The liquid ejection device of claim 4 wherein the at least one ridge or groove is linear, elliptical, circular or arcuate.
7. The liquid ejection device of claim 4 including multiple ridges or grooves are provided they may be parallel, concentric or intersecting.
8. The liquid ejection device of claim 1 wherein the surface of the wall of the chamber adjacent the fluid inlet port includes second means to reduce fluid flow through the aperture toward the inlet port as the paddle moves from the rest state to the ejection state.
9. The liquid ejection device of claim 8 wherein the second means includes an angling into the chamber of the surface of the wall of the chamber around the fluid inlet port.
10. The liquid ejection device of claim 1 wherein the rear surface of the paddle includes third means to encourage fluid flow into the chamber as the paddle moves from the ejection state to the rest state.
11. The liquid ejection device of claim 10 wherein the third means includes an angling into the chamber of the rear surface of the paddle.
12. The liquid ejection device of claim 11 wherein the angling of the rear surface is limited to the peripheral region of the rear surface.

13. The liquid ejection device of claim 1 wherein the inlet port is configured to encourage fluid flow into the chamber as the paddle moves from the ejection state to the rest state.

5 14. The liquid ejection device of claim 1 wherein the surface of the wall of the inlet port adjacent to the paddle is angled into the chamber such that the aperture decreases in area toward the chamber.

10 15. The liquid ejection device of claim 1 wherein the paddle is of constant thickness.

16. A liquid ejection device including:

a fluid chamber having:

a fluid outlet port in a wall of the chamber;

15 a fluid inlet port in a wall of the chamber;

a paddle located in the chamber and moveable in a forward direction between a rest state and an ejection state, for ejecting fluid from the chamber through the outlet port as it moves from the rest state to the ejection state; wherein the paddle is positioned to substantially close the inlet port when in the rest state, the paddle and the port defining an aperture there between; and,

20 wherein the paddle has a forward surface, the forward surface having a central portion and a peripheral portion, at least part of the peripheral portion extending outwardly from the central portion in the forward direction.

25 17. The liquid ejection device of claim 16 wherein said at least part extends at a substantially constant angle to the forward direction

18. The liquid ejection device of claim 16 wherein said at least part extends at a non-constant angle to the forward direction.
19. The liquid ejection device of claim 16 wherein substantially all of the peripheral portion extending outwardly from the central portion in the forward direction.
20. The liquid ejection device of claim 16 wherein central portion extends generally perpendicular to the forward direction.
21. The liquid ejection device of claim 16 wherein paddle is of a constant thickness.
22. The liquid ejection device of claim 16 wherein the surface of the wall of the chamber defining the inlet port is angled into the chamber.
23. The liquid ejection device of claim 16 wherein the inlet port is defined by the wall of the chamber extending over the end of a fluid passage way to form a fluid inlet convergent in the downstream direction.
24. A method of manufacturing a micro mechanical device which includes a movable paddle, the method utilising semiconductor fabrication techniques and including the steps of:
- a) depositing a first layer of sacrificial material;
  - b) depositing at least a second layer of sacrificial material on a selected part or parts of the first layer; and
  - c) depositing a paddle forming layer of material over the first and second layers of sacrificial material to form a non-planar paddle.

25. The method of claim 24 wherein step b) includes depositing one or more additional layers of sacrificial material on selected parts of the second layer.
- 5 26. The method of claim 25 wherein the additional layer or layers are deposited on only part of the second layer.
27. The method of claim 24 wherein the second layer is deposited to lie under the peripheral region of the as yet unformed paddle.

**INTERNATIONAL SEARCH REPORT**

International application No.  
**PCT/AU00/00333**

**Box I Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos :  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2. ☐ Claims Nos :  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
  
3. ☐ Claims Nos :  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a)

**Box II Observations where unity of invention is lacking (Continuation of item 3 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1. Claims 1-23 are directed to a liquid ejection device with a fluid chamber, and a paddle which has a rest state and an ejection state. The paddle position is and a means on the paddle to reduce fluid flow are essential. These features combined are regarded as a first "special technical feature".

Continued on extra sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:1-23

**Remark on Protest** ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/AU00/00333

**Supplemental Box**

(To be used when the space in any of Boxes I to VIII is not sufficient)

**Continuation of Box No: II**

2. Claims 24-27 are directed to a micro mechanical device which includes a paddle (for what?) and goes on to define a semiconductor fabrication technique for depositing layers to form the device. The fabrication method for manufacturing the micro mechanical device is regarded as a second "special technical feature".

Since the abovementioned groups of claims do not share either of the technical features identified, a "technical relationship" between the inventions, as defined in PCT rule 13.2 does not exist. Accordingly the international application does not relate to one invention or to a single inventive concept

**INTERNATIONAL SEARCH REPORT**  
Information on patent family members

International application No.  
**PCT/AU00/00333**

This Annex lists the known "A" publication level patent family members relating to the patent documents cited in the above-mentioned international search report. The Australian Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
